

Annulus convection - transcript

started 2026-09-15T14:32:34+10:00 - no terminator: still running, or interrupted - 3 parts

- ran; a step reads down, the path joining what ran in the order it ran
- solved, and converged
- converged, but a fieldsplit block hit its iteration cap - that block did not solve
- did not converge; the reason is in the record
- ran in a step that was then abandoned
- did nothing in this step
- the steps between did exactly this, unchanged; first and last values are shown where they differ
