

Annulus convection - transcript

started 2026-09-15T13:18:44+10:00 - no terminator: still running, or interrupted - 3 parts

- ran; a step reads down, the path joining what ran in the order it ran
- ✓ solved, and converged
- ! converged, but a fieldsplit block hit its iteration cap - that block did not solve
- ⊗ did not converge; the reason is in the record
- ⊗ ran in a step that was then abandoned
- did nothing in this step
- ↓ the steps between did exactly this, unchanged; first and last values are shown where they differ

Key - the parts, and what is in their residuals

AdvDiffusion(T)

recorded at step 0

Delta t_18 = 1.147e-06 - DDt timestep
a^AM_0,18 = 0.5 - a^{\mathrm{AM}} coefficient 0 (DDt instance 18)
a^AM_1,18 = 0.5 - a^{\mathrm{AM}} coefficient 1 (DDt instance 18)
C^tau_kappa,18 = 4 - tau diffusive weight
C^tau_t,18 = 2 - tau transient weight
C^tau_u,18 = 2 - tau advective weight
kappa = 1e-06 m^2/s - Diffusivity
w^SUPG_18 = 1 - SUPG term weight (0 = Galerkin)
essential on Lower: 1
essential on Upper: 0

Stokes(v)

recorded at step 0

rho_0 alpha g = 0.9712 kg/K/m^2/s^2 - buoyancy coefficient: reference density x thermal expansivity x gravity
eta = 1e+22 Pa-s - Shear viscosity
lambda = 0 - Numerical Penalty
rotated free-slip on Upper: u . n = 0
rotated free-slip on Lower: u . n = 0
